0.1 A Section

Hello world! In Section ??, we ...

Let X_1, X_2, \dots, X_n be a sequence of independent and identically distributed random variables with $E[X_i] = \mu$ and $\text{Var}[X_i] = \sigma^2 < \infty$, and let

$$S_n = \frac{1}{n} \sum_i^n X_i$$

denote their mean. Then as n approaches infinity, the random variables $\sqrt{n}(S_n - \mu)$ converge in distribution to a Normal $N(0, \sigma^2)$.

It is possible to use $\hat{x} = (A^T A)^{-1} A^T b$. This is adequate, however ? showed that it's possible to use symmetric semidefinite cheeseburgers...
